# Certificate

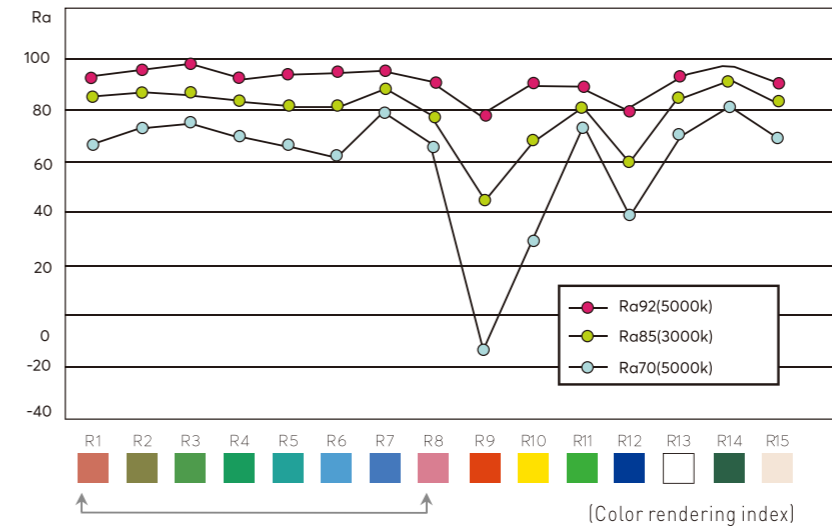

# High color rendering index

A high color rendering index (Ra ≥ 90) makes the subject natural and fresh. Currently only few LED products have this feature. The use of high power products with high IRC, marks standout the color and the features of materials, perfectly reflecting the color of the subject, especially people. It is an ideal lighting solution for shops and social activities places.

Average Ra evaluation index

Ra Evaluation index is applied to estimate the color rendering index of the lighting product to see the reflection level of natural color compared to those given by conventional lightings.

Average color rendering index ranges from R1 to R8.

The eight values of color rendering index average

# Color rendering index for white led

Ra is the average from R1 to R8. When designing high CRI LED, attention should not only be paid on average Ra, but also on R9 (colour rendering value for saturated red) and on the average of value from R9 to R12 for red, yellow, green, blue. Studies have demonstrated that there is a gap between Ra and the visual evaluation of the color of the white LED. White LEDs with low Ra may look very beautiful, while others with high Ra may appear less pleasant. High IRC can be ensured in the white LED, when both the Ra and R9 have high value.

# R9?

R9 refers to a saturated red, with a wavelength of 650nm. With low R9, the red component is not sufficient, so the lamp does not render the color naturally. The higher the Ra value, the better the red rendering. Higher values, give a better aspect to fruit and flowers, making them look more brightly colored. In particular for commercial lighting, the use of products with low R9 is should be avoided.

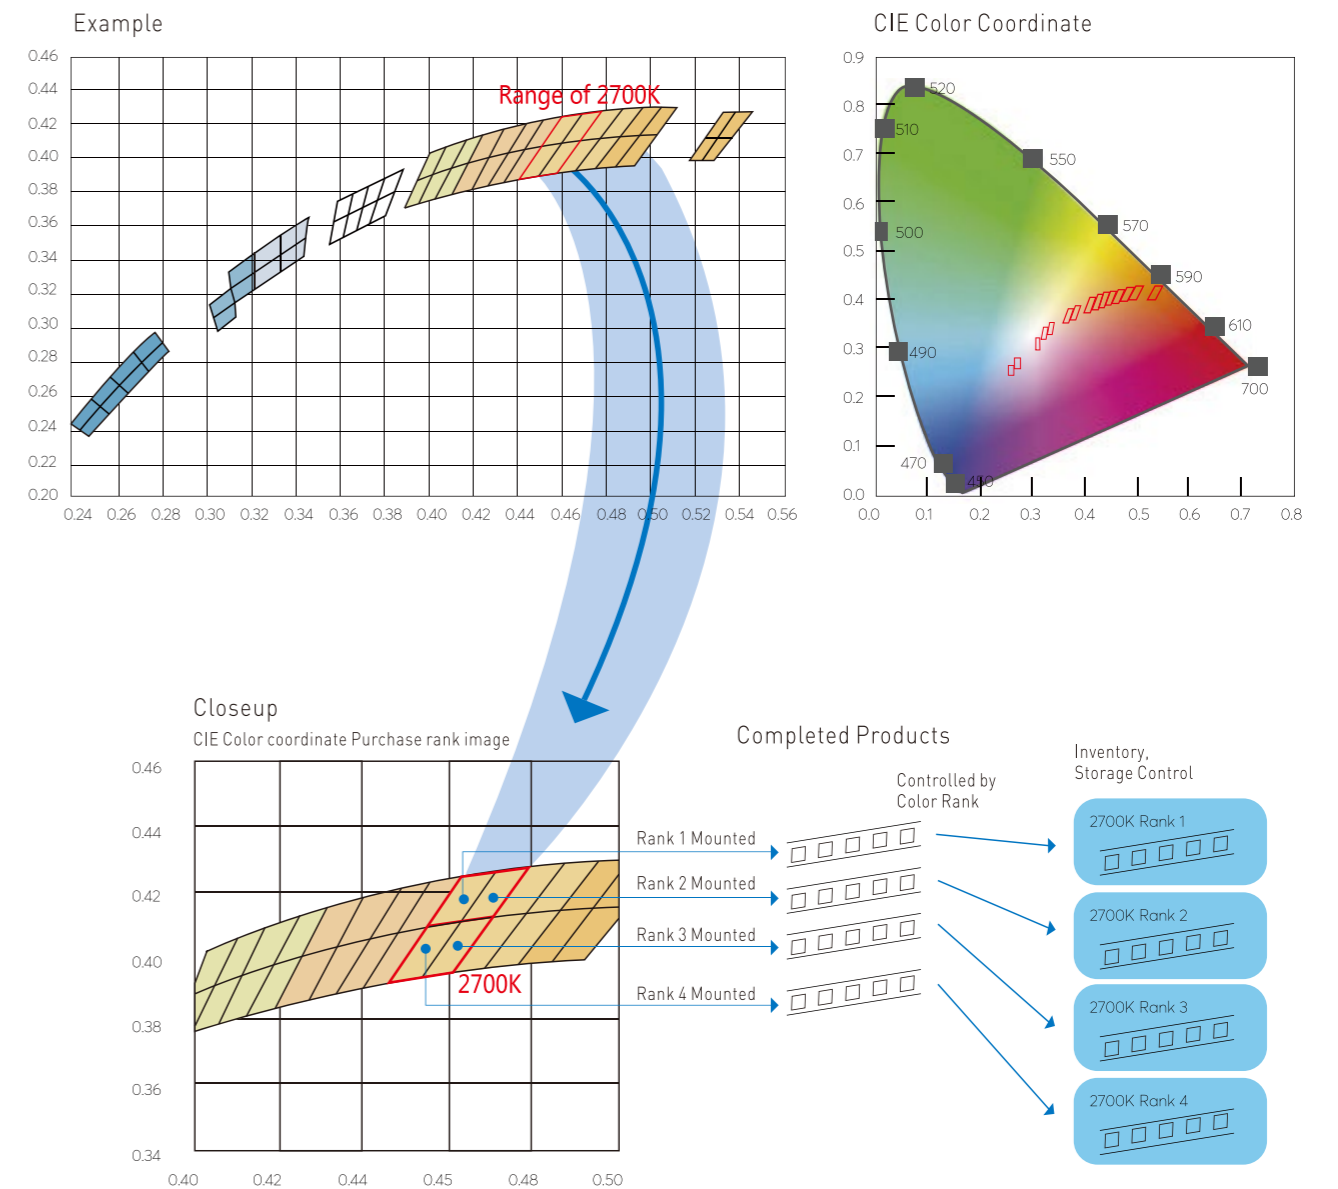

# Color consistency

Front-End Control

The LEDs are selected by color coordinates and divided into ranks. Ranks are not mixed with other ranks when they are mounted on printed circuit boards. Mounting, inventory and shipping management are performed by ranks. In addition, a visual color inspection of all the units is carried out when the finished product are delivered.

# New waterproofing technology Introduction

## Are you concerned about maintaining the CCT of waterproof LED strip?

After applying silicone/PU waterproof glue, the color temperature of LED strips usually increases about 300K-500K. That can be a problem. Also, when using traditional waterproofing technology it is difficult to maintain the same color temperature for every order.

### Good news !

We are now using a new waterproofing technology with silicone extrusion molding which makes it possible to control the color temperature, allowing us to maintain a guaranteed CCT tolerance within  $\pm 100K$  for each order.

### How and why does it work?

Traditional waterproof coatings (such as silicone glue or PU glue) bond to the LED diodes directly. Because the LED diodes also have their own silicone coating, these two layers of silicone material cause a change in the CCT.

However, our new technology using silicone extrusions can now prevent this problem. Each model of LED strip has its own specific extrusion mold for waterproofing (as shown in the pictures below).

Using these specific molds, the silicone will not touch the LED diode directly, which means the LED strip can now maintain the same color temperature as the original LED diode.

The maximum length can be up to 50 meters per roll.

Both IP65 and IP67 waterproofing levels are available.
